

IN THE ABSTRACT:

Please cancel prior Abstract and insert the following:

--A microstructure includes a support substrate, a movable plate, and an elastic support portion having a first section with at least one concave portion and second sections having no concave portions. The second sections are arranged at both longitudinal ends of the first section and connect with the movable plate and the support substrate, respectively. The movable plate is supported by the elastic support portion so that the movable plate can be freely torsion-vibrated to the support substrate about a torsion axis.--
